Static:  Dynamic: 

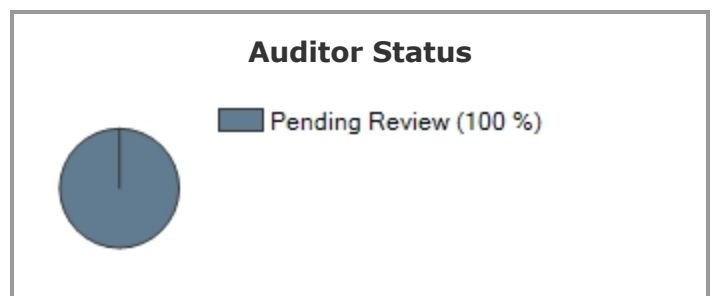

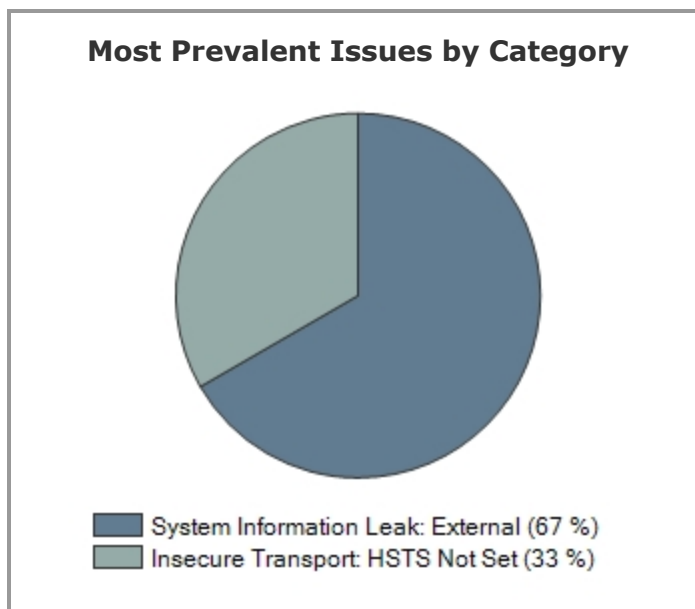

## Application Details

- Scan Test Creator: pavan Kumar sreeramoju - Security Testing: Web Scan - Full Scan  
Agency Name: TCS App CMDB CI #: SC2786581  
CRP Rating: Baseline (Default) Operating Status: Non Production (Stage, Dev, ...)

**Issue Status**

New	Existing	Reopened
1	2	0

## Issue Breakdown

Issues are divided based on their impact (potential damage) and likelihood (probability of identification and exploit).

High impact / high likelihood issues represent the highest priority and present the greatest threat.

Low impact / low likelihood issues are the lowest priority and present the smallest threat.

See Appendix for more information.

Rating	Category	Test Type	
Low	Insecure Transport: HSTS Not Set	Dynamic	1
Low	System Information Leak: External	Dynamic	1
Info	System Information Leak: External	Dynamic	1

Vulnerabilities in your applications may take some time to remediate, test and move to production. In the meantime, we suggest HPE Application Defender to virtually patch these vulnerabilities. App Defender is installed from the cloud and begins monitoring and protecting your applications in minutes. A free trial is available at [www.hpeapplicationdefender.com](http://www.hpeapplicationdefender.com). The team is ready to help you. Give it a try or contact us at [hpeappdefender@hpe.com](mailto:hpeappdefender@hpe.com).

## Issue Breakdown by OWASP Top 10 2013 PCI Sections 6.3, 6.5 & 6.6

The OWASP Top Ten represents a broad consensus about what the most critical web application security flaws are. Project members include a variety of security experts from around the world who have shared their expertise to produce this list.

The PCI compliance standards, particularly sections 6.3, 6.5, and 6.6, reference the OWASP Top Ten vulnerability categories as the core categories that must be tested for and remediated.

OWASP Category	Severity			
	Critical	High	Medium	Low
A1 - Injection				
A2 - Broken Authentication and Sessi...				
A3 - Cross-Site Scripting (XSS)				
A4 - Insecure Direct Object References				
A5 - Security Misconfiguration				
A6 - Sensitive Data Exposure				
A7 - Missing Function Level Access C...				
A8 - Cross Site Request Forgery (CS...				
A9 - Using Components with Known ...				
A10 - Unvalidated Redirects and Forw...

# Issue Breakdown by Analysis Type

Issues are divided based on their impact (potential damage) and likelihood (probability of identification and exploit).

High impact / high likelihood issues represent the highest priority and present the greatest threat.

Low impact / low likelihood issues are the lowest priority and present the smallest threat.

See Appendix for more information.

Category	Static	Dynamic
Insecure Transport: HSTS Not Set	0	1
System Information Leak: External	0	2
Total	0	3

## Issue Detail

Below is an enumeration of all issues found in the project. The issues are organized by priority and category and then broken down by the package, namespace, or location in which they occur.

The priority of an issue can be Critical, High, Medium, or Low.

Issues from static analysis reported on at same line number with the same category originate from different taint sources.

### 6.1.1 Insecure Transport: HSTS Not Set

Low

CWE-319

OWASP Top 10:

PCI 3.0:

#### Summary

Http Strict Transport Security (HSTS) policy enables web applications to enforce web browsers to restrict communication with the server over an encrypted SSL/TLS connection for a set period. Policy is declared via special Strict Transport Security response header. Encrypted connection protects sensitive user and session data from attackers eavesdropping on network connection.

Consider following attack scenarios:

- Users often omit the URI scheme i.e. https:// when typing a URL in location bar to access a website. Also third party websites can link to the site using the "http" scheme instead of "https". This could result in an initial connection to a HTTPS-enabled site over an unencrypted channel. An eavesdropping attacker can hijack this unencrypted connection and replace the intended use of HTTPS protocol with HTTP in an attack known as SSLStrip, granting unauthorized access to all subsequent traffic.
- Websites often transfer non-sensitive resources such as help documents over an unencrypted HTTP connection. Any cookies without a secure flag are sent along with such requests potentially disclosing sensitive user and session data to eavesdropper.
- Man-in-the-Middle attacks that exploit user tendencies to override invalid certification warnings, e.g. SSLSniff.

For web sites configured with an accurate HSTS policy, browsers automatically upgrade any HTTP connections to HTTPS. Furthermore, browsers prevent users from overriding any host certificate warnings. HSTS offers an effective defense against above attack scenarios.

#### Explanation

A successful MiTM attack such as SSLStrip or SSLsniff can lead to the compromise of sensitive user data such as financial information, Social Security Number, personal information etc. as well as grant unauthorized access to user accounts enabling attackers to perform privileged actions on client's behalf.

#### Execution

Access location <https://pfpfizerpropldev5.prod.acquia-sites.com:443/> and examine response headers in raw response. This header is missing from the list.

#### Recommendation

Configure the web application under test to include Strict-Transport-Security header in every response from Https enabled site. Any Http version of site on the same domain should permanently

redirect to the secure encrypted site. Header should not be added to Http response as browsers will ignore it.

It is important to note that this header does not prevent from above mentioned attack scenarios when user first time ever access the site or accesses after the set period has expired. This instance can be avoided by getting the site added to the pre-loaded HSTS hosts list embedded in both Chrome and Firefox browsers.

## 6.1.2 System Information Leak: External

Low

CWE-200

OWASP Top 10:

PCI 3.0:

### Summary

Robots.txt is a file that system administrators place on web servers that instructs automated crawling engines such as Google and Altavista to not index or crawl certain portions of the site, usually because they would cause the site's web applications to malfunction, or because they contain sensitive information or applications that should not be displayed in search engine results.

### Explanation

An attacker can use the information in the robots.txt file to determine where sensitive or "hidden" application or information is on the site.

### Execution

<http://pfpfizerpropldev5.prod.acquia-sites.com:80/robots.txt>

### Recommendation

If robots.txt is not needed, then remove it. If the file is needed, then ensure that it does not contain the locations of hidden or sensitive applications.

### References

# Appendix - Descriptions of Key Terminology

## Security Rating

The HPE Security Fortify on Demand 5-star assessment rating provides information on the likelihood and impact of defects present within an application. A perfect rating within this system would be 5 complete stars indicating that no high impact vulnerabilities were uncovered.

Rating	
	HPE Security Fortify on Demand awards one star to projects that undergo a HPE Security Fortify on Demand security review, which analyzes a project for a variety of software security vulnerabilities.
	HPE Security Fortify on Demand awards two stars to projects that undergo a HPE Security Fortify on Demand security review that identifies no high likelihood / high impact issues. Vulnerabilities that are trivial to exploit and have a high business or technical impact should never exist in business-critical software.
	HPE Security Fortify on Demand awards three stars to projects that undergo a HPE Security Fortify on Demand security review that identifies no low likelihood / high impact issues and meets the requirements needed to receive two stars. Vulnerabilities that have a high impact, even if they are non-trivial to exploit, should never exist in business critical software.
	HPE Security Fortify on Demand awards four stars to projects that undergo a HPE Security Fortify on Demand security review that identifies no high likelihood / low impact issues and meets the requirements for three stars. Vulnerabilities that have a low impact, but are easy to exploit, should be considered carefully as they may pose a greater threat if an attacker exploits many of them as part of a concerted effort or leverages a low impact vulnerability as a stepping stone to mount a high-impact attack.
	HPE Security Fortify on Demand awards five stars to projects that undergo a HPE Security Fortify on Demand security review that identifies no issues.

## Likelihood and Impact

### Likelihood

Likelihood is the probability that a vulnerability will be accurately identified and successfully exploited.

### Impact

Impact is the potential damage an attacker could do to assets by successfully exploiting a vulnerability. This damage can be in the form of, but not limited to, financial loss, compliance violation, loss of brand reputation, and negative publicity.

## HPE Security Fortify on Demand Priority Order

### Critical

Critical-priority issues have high impact and high likelihood. Critical-priority issues are easy to detect and exploit and result in large asset damage. These issues represent the highest security risk to the application. As such, they should be remediated immediately.

SQL Injection is an example of a critical issue.

## High

High-priority issues have high impact and low likelihood. High-priority issues are often difficult to detect and exploit, but can result in large asset damage. These issues represent a high security risk to the application. High priority issues should be remediated in the next scheduled patch release.

Password Management: Hardcoded Password is an example of a high issue.

## Medium

Medium-priority issues have low impact and high likelihood. Medium-priority issues are easy to detect and exploit, but typically result in small asset damage. These issues represent a moderate security risk to the application. Medium-priority issues should be remediated in the next scheduled product.

Path Manipulation is an example of a medium issue.

## Low

Low-priority issues have low impact and low likelihood. Low-priority issues can be difficult to detect and exploit and typically result in small asset damage. These issues represent a minor security risk to the application. Low priority issues should be remediated as time allows.

Dead Code is an example of a low issue.

## Issue Status

### New

New issues are ones that have been identified for the first time in the most recent analysis of the application.

### Existing

Existing issues are issues that have been found in a previous analysis of the application and are still present in the latest analysis.

### Reopened

Reopened issues have been discovered in a previous analysis of the application but were not present in subsequent analyses. These issues are now present again in the most recent analysis of the application.

## HPE Security Fortify on Demand Remediation Effort Estimate

### Major Remediation

Major remediation effort issues must often be addressed at multiple locations to fix the root problem.

### Minor Remediation

Minor remediation effort issues can typically be addressed at the location of the root problem.
